

NEWS RELEASE

A Submission for an Marketing Approval of Cardiovascular Patch is Filed in Japan

Tokyo, Japan, March 27, 2023 --- [Osaka Medical and Pharmaceutical University](#), [Fukui Tateami Co., Ltd.](#) and [Teijin Limited](#) announced today that the consortium has applied for approval to market the OFT-G1 (development code) patch for cardiovascular surgery in Japan. [Teijin Medical Technologies Co., Ltd.](#), a Teijin Group company, will be responsible for developing, manufacturing and distributing the OFT-G1.

The three parties, having established the OFT-G1's efficacy and safety by conducting cases in Japan, will continue to improve their current technologies as well as develop a product pipeline strategy aimed at contributing to the treatment and quality of life of patients with congenital heart defects (CHD) in Japan and ultimately worldwide.

Teijin Medical Technologies has extensive experience in manufacturing and sale of biodegradable surgical materials with quality-control technologies. The company's expertise will be leveraged in order to launch and deliver the OFT-G1 to patients with congenital heart disease as quickly as possible.

A schema of the implanted OFT-G1

Developed own native tissue over the OFT-G1 (pre-clinical study)

Thanks to medical advances in recent decades, the vast majority of pediatric patients with heart diseases reach adulthood. A considerable number of these patients, however, eventually require re-interventions, such as repeat surgery or catheter therapy, due to problems with the implanted surgical materials. There still exist unsolved drawbacks of the existing materials, such as deterioration, calcification, and thickening with pseudo-intimal proliferation. Furthermore, such materials have no size adaptability to body growth. As a result, hemodynamic disturbance often occurs again to be treated by the re-interventions in their long life.

To solve this significant clinical problem, the three parties have devoted their efforts to researching and developing the OFT-G1 by introducing a totally new concept. The OFT-G1 is a knitted fabric consisting of bio-absorbable and non-absorbable yarns coated with

cross-linked gelatin. After implantation into the body, own native tissue grows and gradually surrounds the stretchable non-absorbable yarn while the bio-absorbable parts disappear. The regenerated tissue has the potential to reduce the risk of inflammatory reactions and degradation and thereby prevent the need for re-intervention.

In a clinical trial started in Japan since May 2019, no problems or reoperations due to OFT-G1 have currently occurred. As such, the OFT-G1 patch is expected to alleviate not only physical problems but also psychological burdens due to unwanted re-interventions.

The development of the OFT-G1 has been supported by the Ministry of Economy, Trade and Industry since 2014 as well as a program launched in 2017 by the Japan Agency for Medical Research and Development (AMED) to facilitate collaboration between medical academia and industry. Japan's Ministry of Health, Labor and Welfare designated the OFT-G1 as a "SAKIGAKE" device in April 2018, providing various incentives to speed up an approval for clinical use.

About Osaka Medical and Pharmaceutical University

Osaka Medical and Pharmaceutical University is a comprehensive institution that offers education and research in department of medicine, pharmacy, and nursing. The university has been providing thousands of clinical professionals by its unique curriculum. Not only basic scientific research but also interdisciplinary research activities are conducted to solve unmet medical needs. Of note, various medical devices have been invented there by active industry-academia-government collaborations.

The University Hospital provides various advanced medical treatments, such as the state-of-the arts cancer therapy including boron neutron capture therapy, robot surgery, and genomics medicine.
